

## SUBMISSION

### New ways to power electricity consumers

Further to your request for submissions to better reflect the true value of consumers who sell power from solar systems I wish to suggest the following:

**“That solar power users with battery storage who sell excess electricity to the grid should be given a discounted line charge.”**

The lower demand on the electricity system due to consumers who have installed solar systems should lead to lower lines cost.

I suggest this as it would be fairer to solar system owners and would help encourage a higher uptake of solar systems.

Kevin Atkinson
