

Here's a more conversational version of your text:

I'm on board with giving consumers more choices and believe that flexible, distributed energy generation can help lower costs for everyone in the long run. However, I'm not convinced that the proposed solution of principles-based rebates is the way to go for making distributors pay when consumers supply electricity during peak times. (2A)

Instead, I think distributors should be required to pay consumption-linked injection tariffs that are perfectly symmetrical. This should apply to all consumers, not just the mass market. (2B)

I also support the idea of electricity retailers paying a fairer price to consumers who sell power back to the grid. But I think this should be extended to cover dry years and other periods of constrained supply, and it should always reflect the true value of the electricity, not just the extra value during peak times. (2C)

Thank you!

Scott Nesbitt
