

Keeping the lights on: Electricity security of supply snapshot

3 June 2025

Information to help you understand this snapshot

The Electricity Authority Te Mana Hiko is focused on making sure Aotearoa New Zealand has a **reliable and continuous power supply**, ensuring that everyone has electricity when it's needed.

To explain how well the electricity system is functioning to ensure the lights (and kettles, stoves etc) stay on, we have published a new explainer that we are calling Keeping the lights on.

Every week, we will publish a 'snapshot' of how our system is looking in terms of overall security, together with supporting information on rainfall, hydro storage, geothermal generation and wholesale electricity prices.

The graph on page 5 shows the **Electricity Risk Curves (ERCs) and national hydro storage**. The ERCs are based on how much fuel is available to generate electricity. They are designed to show how low hydro storage would need to be to cause concern about security of supply.

The black line shows where hydro storage normally is during the year, and the blue line shows how much hydro storage there has been since 2023. **You can see that it is currently lower than it typically is at this time of year, but it hasn't reached the ERCs, and it is increasing.**

The three maps of Aotearoa New Zealand on page 6 show **the forecast rainfall over the next 35 days**.

The winter 2024/2025 comparison chart shows 'contingent arrangements' – the amount of fuel that is stored should it be needed for power generation. There has been a significant increase in fuel available for this winter compared to last winter.

The chart on page 8 shows **the amount of power generation infrastructure 'on outage'**, which means it will not be available to generate electricity.

The chart on page 9 provides **an estimate of spot prices for this month and quarter**, based on recent prices and forward prices.

The final chart, on page 10, shows **wholesale forward prices** - the cost for purchasing electricity for a given time period in advance. They reflect expectations of future electricity demand and generation costs.

This week's snapshot

This week's data shows that although national hydro storage is still below average, it has increased slightly since last week. Wholesale prices are lower compared to earlier in the quarter as there is currently enough energy (stored coal, water and gas) in the power system to get through the winter.

Storage is still below average, so we would expect more inflows to result in lower prices.

It is important to understand there are different drivers of wholesale and retail price decreases. The current retail prices decreases are driven by increase hydro and gas storage levels.

Summary of overall electricity system risk for the next three months

Wholesale prices

Average daily prices are likely to be around \$170/MWh for the rest of the month and quarter

Security of supply (energy)

Overall risk to national energy supply is significantly lower than last winter

Security of supply (capacity)

Transpower's NZ Generation Balance shows no days where capacity will be a problem

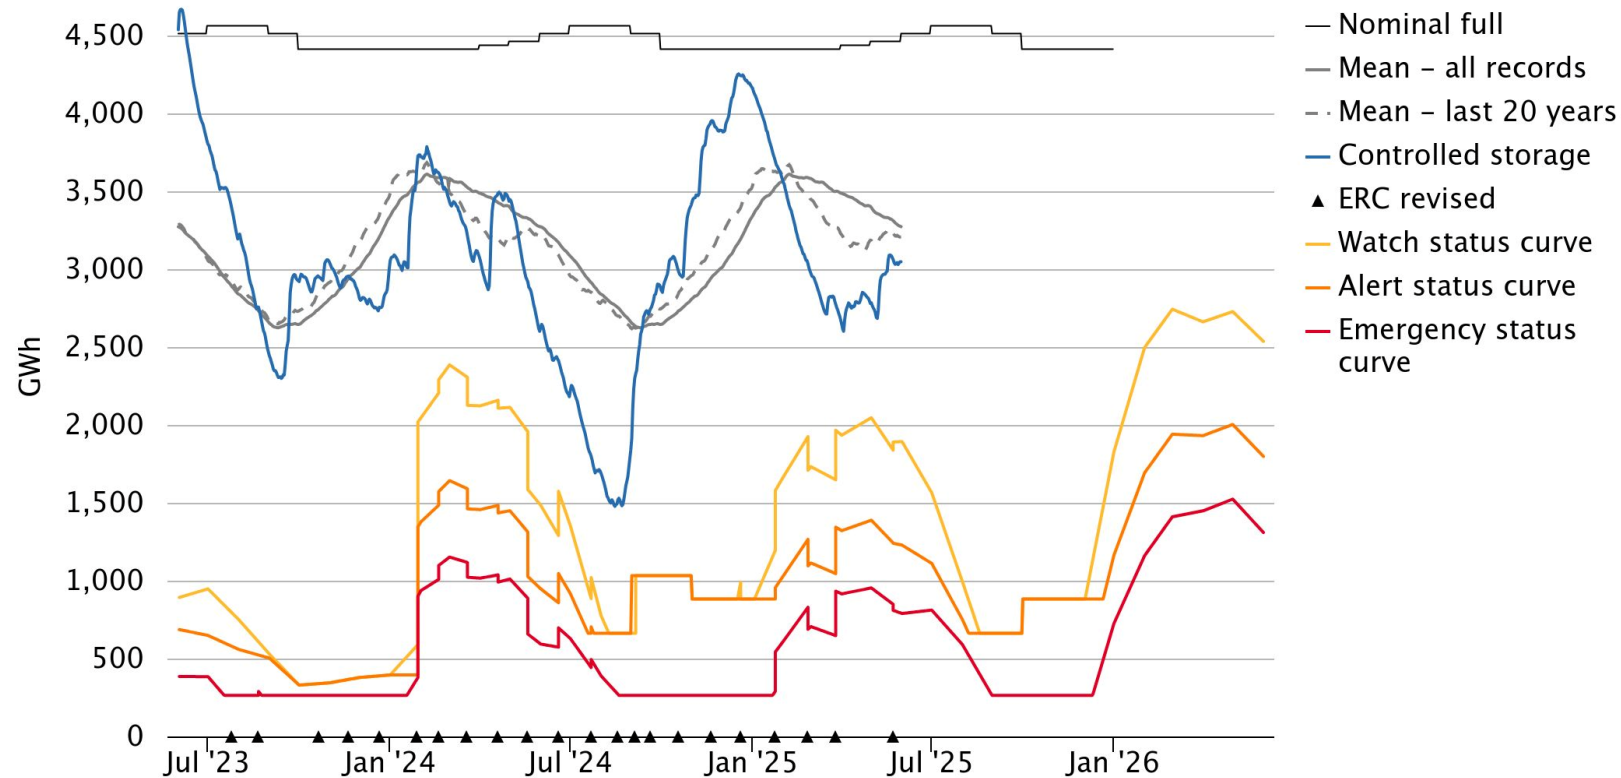

Security of supply outlook for the next three months:

Hydro storage may continue to remain below average, but the recent increase means less pressure on wholesale prices. Fuel supply and generation capacity will be sufficient to meet national demand.

Electricity market information in this snapshot:

- New Zealand Electricity Risk Status Curves (Available GWh)
- 35-day rainfall forecast
- Winter 2024/2025 comparison
- Planned maintenance shut-downs of power generation infrastructure
- Forecast wholesale electricity spot prices
- Forward curve – average future wholesale electricity price.

New Zealand Electricity Risk Status Curves (Available GWh)

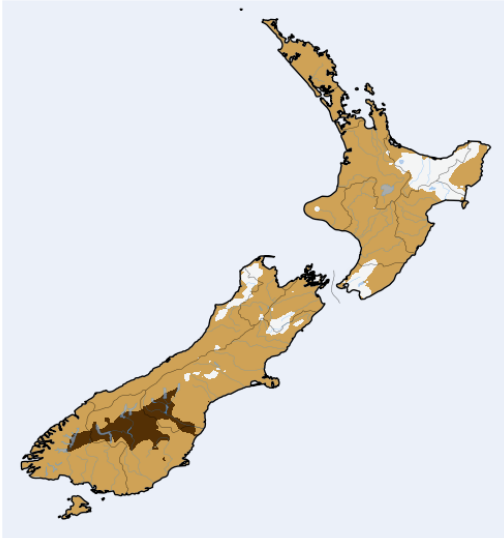

emi.ea.govt.nz/r/vs14y

This chart shows that national hydro storage remains above the risk curves, with a small increase from the recent rainfall but still below the mean for this time of the year.

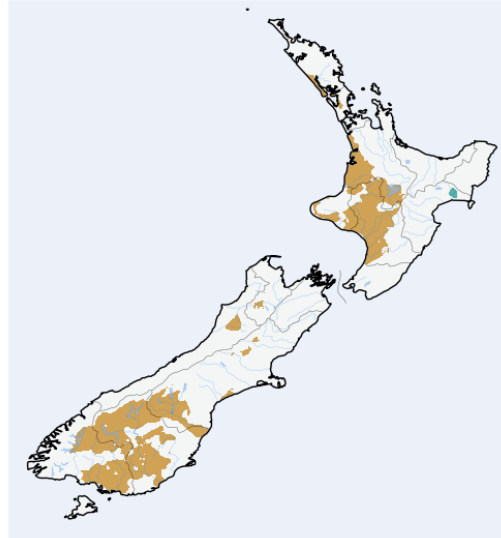

Source: Transpower as the system operator

35-day rainfall forecast

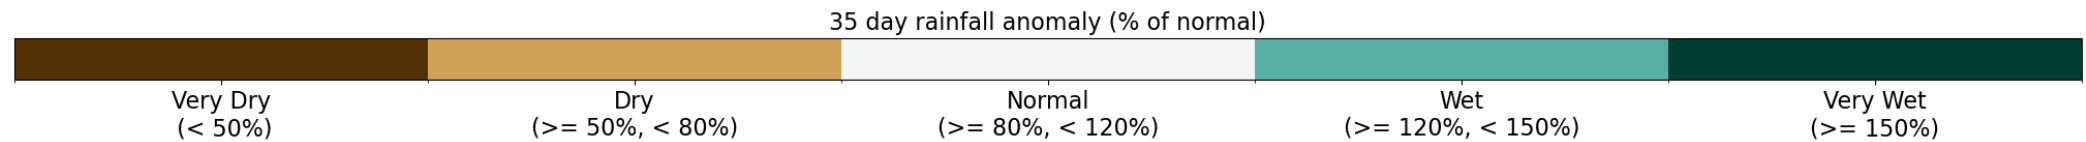

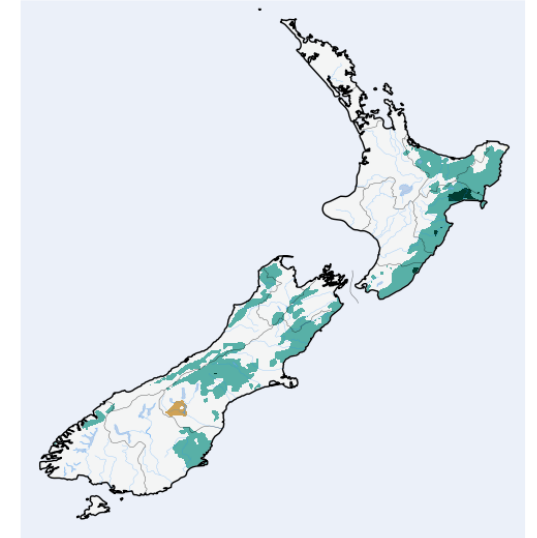

Drier scenario (25th percentile)

Middle scenario (50th percentile)

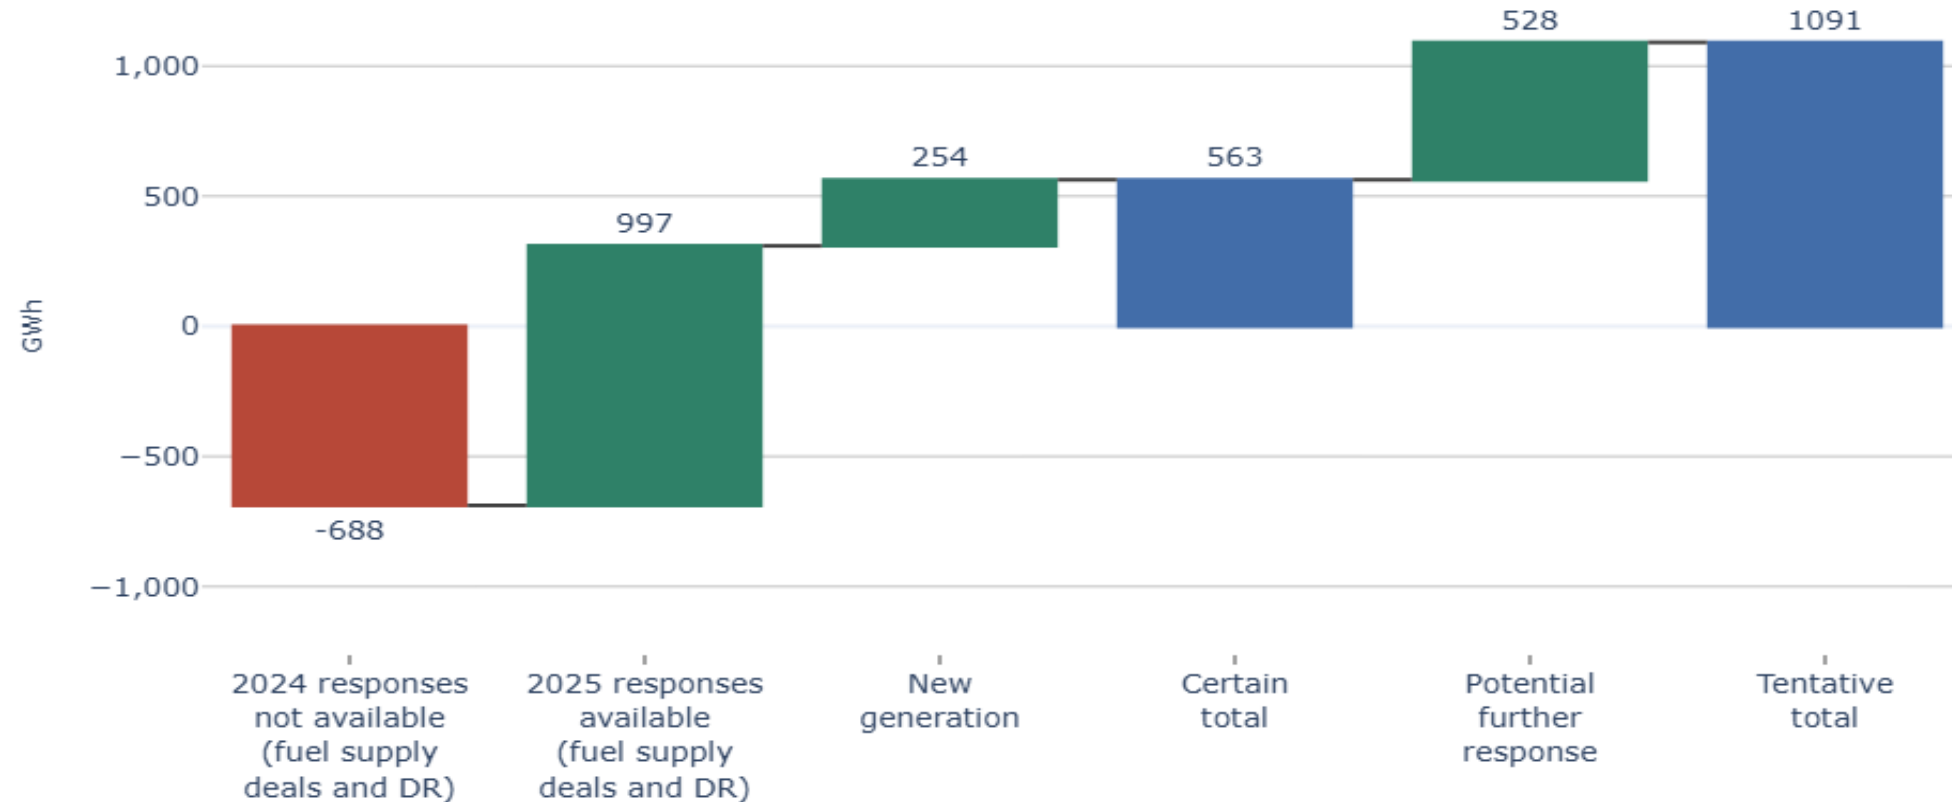

Wetter scenario (75th percentile)

These maps show that this week's forecast is that rainfall over the next 35 days is likely to be low.

Source: NIWA

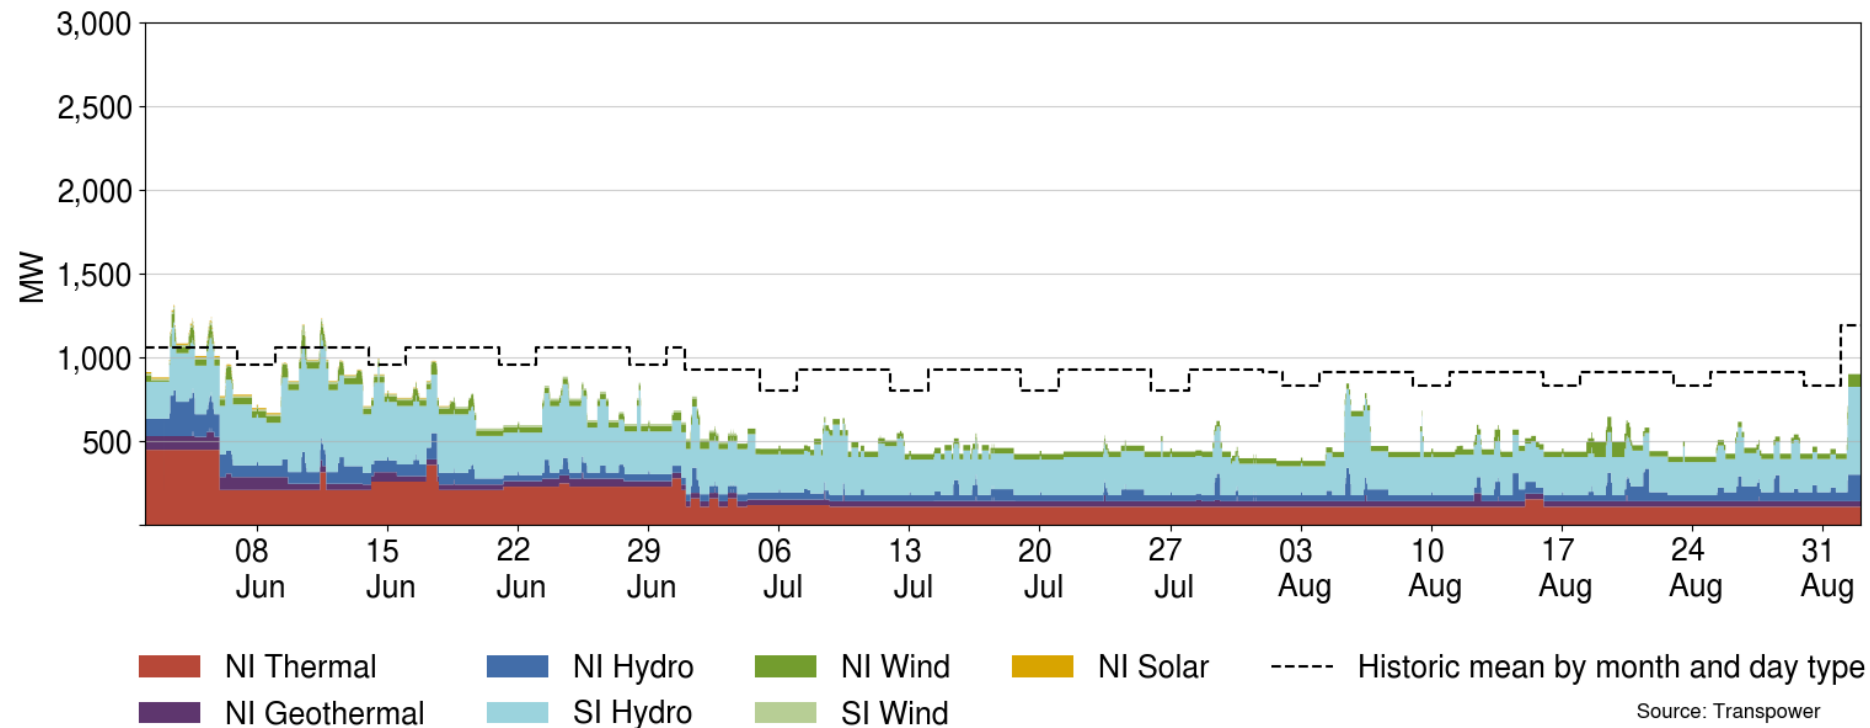

Winter 2024/2025 comparison

Source: Electricity Authority

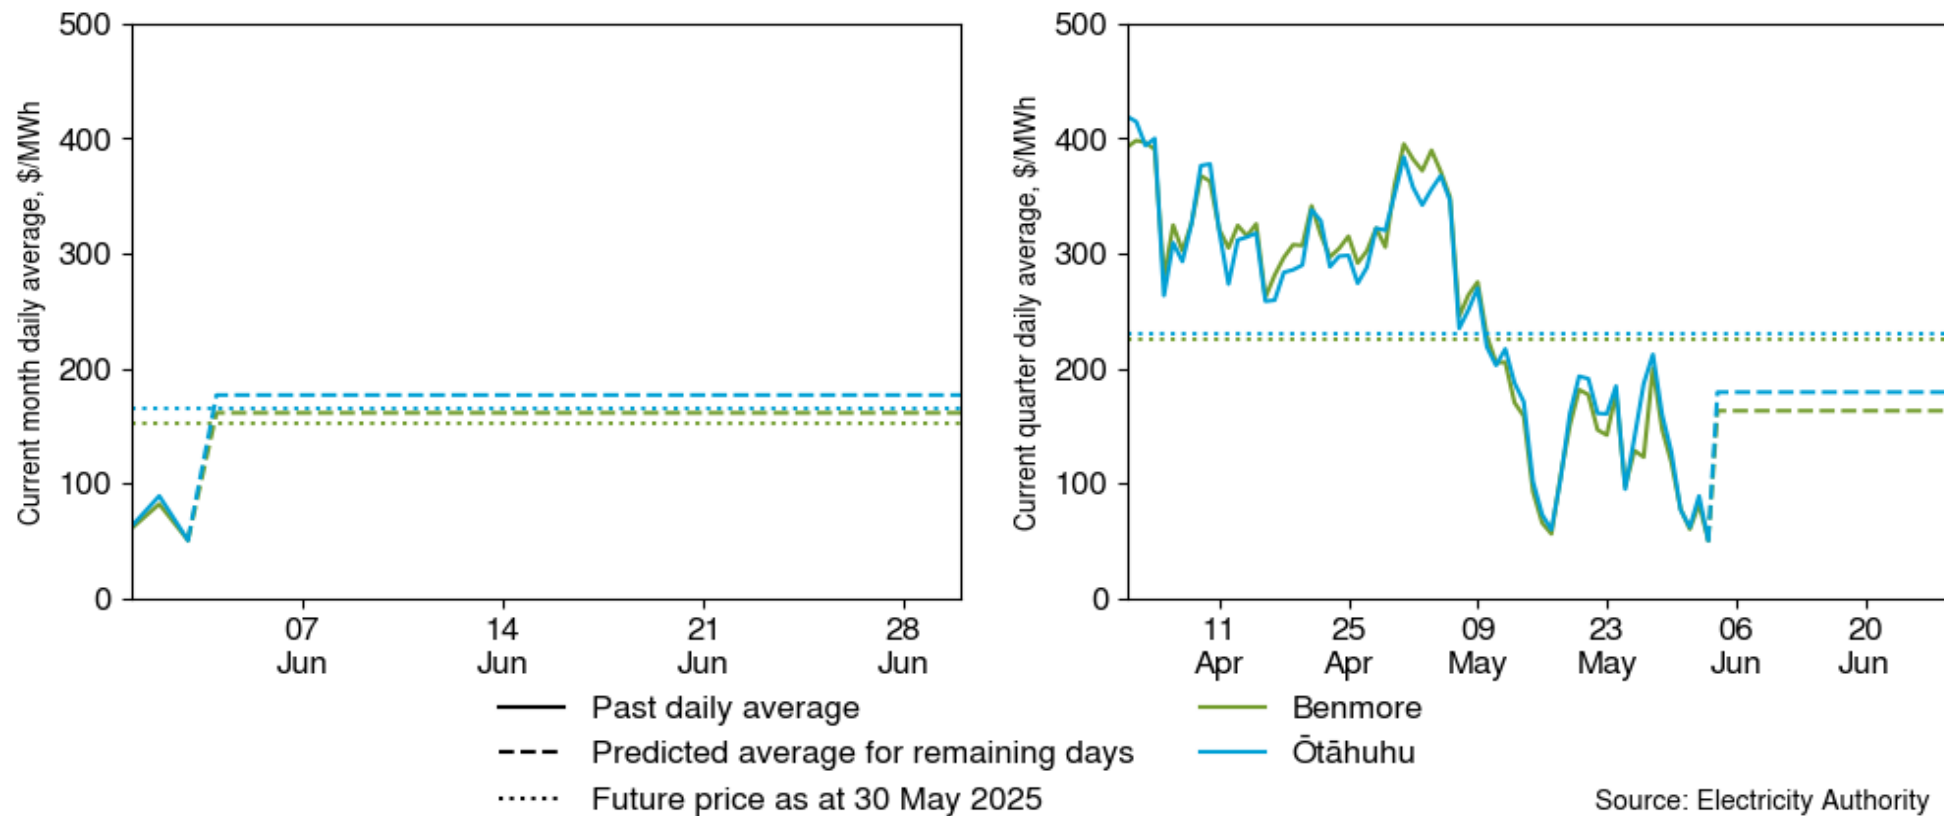

This chart shows that 'contingent arrangements' (fuel stored in case it's needed for power generation) is higher than it was in 2024. This reduces risk for this winter compared to last year, contributing to a total net improvement of 1,091GWh.

Planned maintenance shut-downs of power generation infrastructure – by infrastructure type

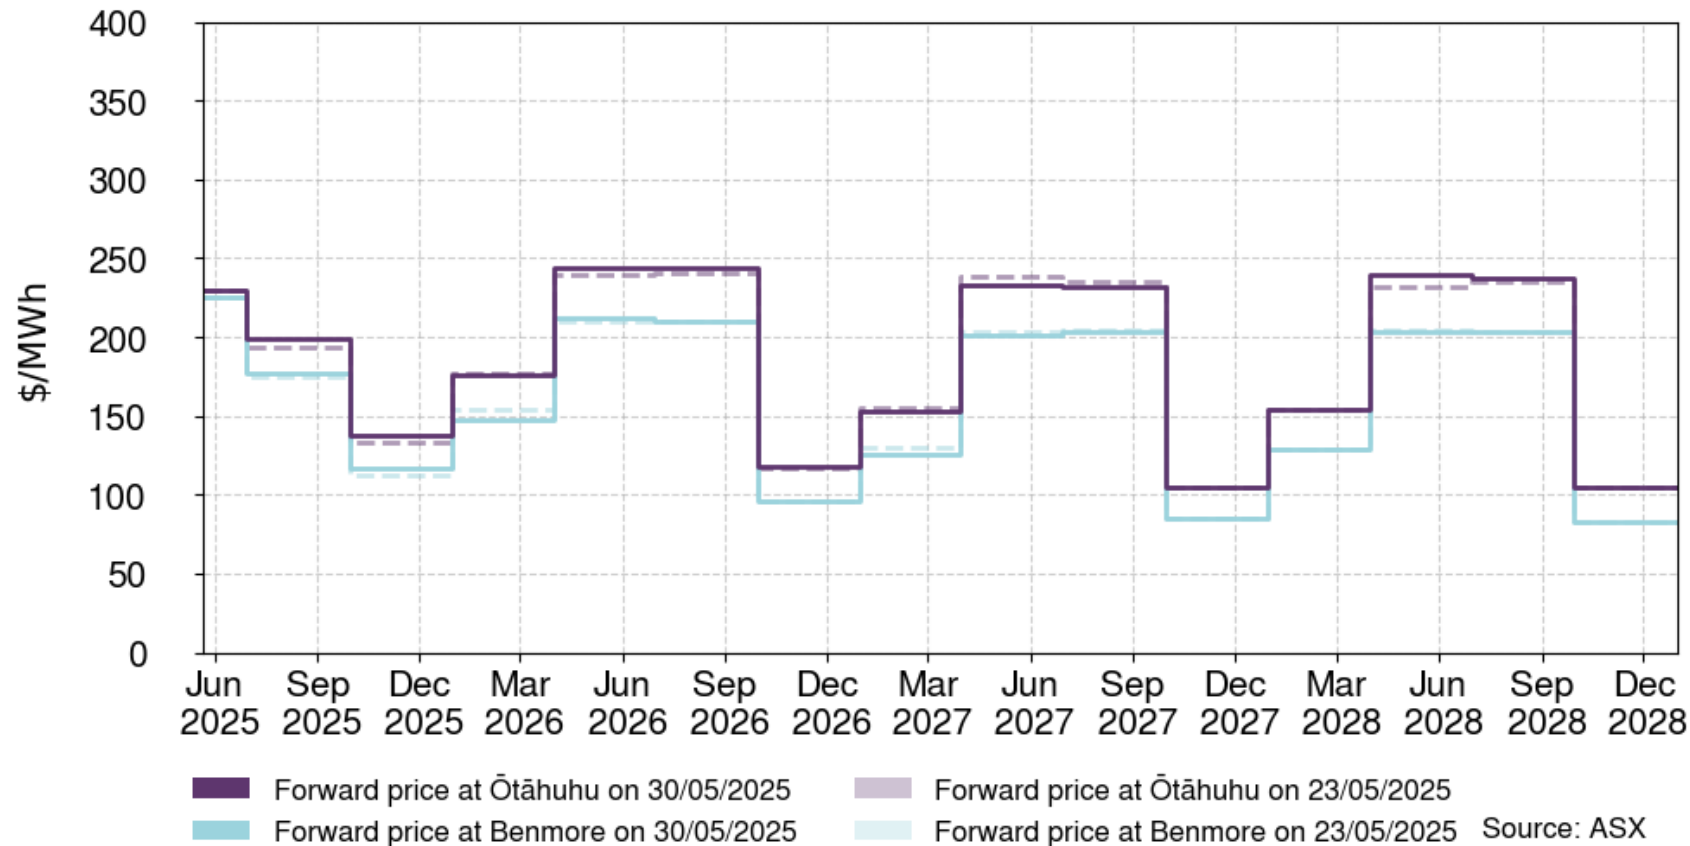

This chart shows that the amount of power generation infrastructure 'on outage' (shut down for planned maintenance) over the next three months is expected to be below average on most days.

Wholesale electricity spot prices

This chart shows that the forecast daily average wholesale spot prices are ~\$169/MWh for this month, and ~\$171/MWh for the quarter. The prices reflect the underlying supply conditions, with recent improvements in hydro storage levels and more gas available.

Forward curve – average future wholesale electricity price

This chart shows that the average future wholesale prices for June 2025 is currently \$230/MWh at Ōtāhuhu and \$225/MWh at Benmore; representing no change from previous week.
