[REDACTED]  
18/11/25

My name is Grant Cole, and I'm a retired man from New Plymouth. I, like many others, am encouraged by the potential of better empowering consumers who are fundamentally reshaping our energy future through investment in distributed generation like rooftop solar, and battery storage.

- I support the Electricity Authority proposals to improve export limits for small-scale distributed generation (DG) by:
  - setting a default 10kW export limit (with allowance to set lower limits where appropriate based on an industry-developed assessment methodology) for small scale distributed generation connections (up to 10kW capacity),
  - setting default voltage response settings for inverters (using Australian setting) and allowing for distributors to set different settings where appropriate.
- I support the Electricity Authority proposals to improve export limits for large-scale distributed generation (DG) by:
  - mandating distributors to use an industry-developed bespoke export limits assessment method to set export limits for larger DG
  - Mandating the use of the latest inverter performance standard for low voltage DG
- Making sure the way bespoke export limits are set for many small businesses, community groups, iwi, hapu, collectives, farms and households who want to install more than 10kW of solar is really important to get right, so that unnecessary limits are not placed on the scale of their solar and battery installations. This critical group of customers installing mid size solar are typically not resourced to engage in the connection process with distributors in the same way that the large utility scale distributed solar and battery firms are. Therefore it's important that the proposed assessment method that distributors use is transparent, fair and its use is monitored by the Electricity Authority to ensure it is not used to unnecessarily limit distributed generation.
- Allowing for distributors to set lower default limits than 10kW where appropriate using an industry-developed export limits assessment methodology, might be needed in specific situations but it should not be used as a way for EDBs to

avoid improving network management approaches to support more customer solar investment and continuing to impose arbitrary unnecessary export limits. Electricity Authority scrutiny should be applied here, to monitor use.

- Currently, there are arbitrary restrictions on the amount of power those with rooftop solar and batteries connected to distribution networks can export to the grid. Higher export limits should speed up distributed generation (eg rooftop solar) and battery adoption rates because the payback period will be reduced and there will be an incentive to install bigger systems. This will increase savings for homeowners and also help bring down the price of electricity for everyone on the network.
- Incentives for producers to supply in high peak times will directly influence lower use of fossil fuels in electricity generation.
- Encouraging community and household energy self reliance contributes to resilience in times of extreme weather events, corporate profiteering, power price increases, energy shortages, increased electricity demand, infrastructure failure and is a readily acquired form of mitigation of and adaptation to climate change.
