
Export limits

Hello

I live in Auckland and have just finished installing a fairly large solar system on my roof. It often hits 10kw of generation that I don't need for my house and I can't store in my battery because it's full already. When doing a google search I noticed that vector should be able to allow export limits of up to 10kw like Aurora energy does and its states that this is assessed on a case by case basis. However when I contacted the vector call center and requested an export limit higher than 5kw, I was basically laughed at and told that nobody has ever had an export limit over 5kw allowed.

This is quite a frustrating situation as there seems to clearly be capacity to allow for a higher export limit but for whatever reason vector is refusing to do this and using its monopoly position to disadvantage its customers and generally be detrimental to NZ by causing energy wastage

I fully support increasing the export limit to 10kw

With regards
Dr Milan Radojevic
